Project Proposal: The Richfield Tech-Connect Hub (RTC Hub)

Theme: *Moving from "Digital Resumes" to "Verifiable Proof of Work"*

---

1. Executive Summary

Current professional platforms like LinkedIn have become oversaturated with "corporate noise," making it difficult for high-potential students to stand out. The **Richfield Tech-Connect Hub (RTC Hub)** is a hyper-localized, technical ecosystem designed to bridge the gap between the Richfield classroom and the South African tech industry. By integrating live code execution, peer-to-peer micro-mentorship, and module-verified skills, RTC Hub provides a "high-signal" environment where competence outshines networking. There will be 2 sides of the app. A IT side and a business side.

2. Core Feature Pillars

A. The "Live-Logic" Feed

- **Syntax-Native Sharing:** Unlike generic platforms, RTC Hub supports full syntax highlighting and **runnable code snippets** (Python, SQL, C++).
- **Problem-Solution Loops:** A dedicated "Bounty" section where students post specific bugs from their current modules (e.g., *Advanced Java Task 2*) and peers earn "Logic Points" for providing verified fixes.
- **Bounty increases the longer a post stays unsolved**
- **The same system would be done for the business side of Richfield where business students can post like a spreadsheet.**

B. The "Shadow-a-Senior" Mentorship Bridge

- Recognizing the intensity of the 3rd-year workload, this feature allows 1st and 2nd-year students to "subscribe" to the project documentation of seniors.
- **Legacy Transfer:** When seniors graduate, they can "Archive" their best project roadmaps and study guides into a library for the next generation, ensuring institutional knowledge stays within Richfield.

C. Verified "Skill-Graph" Portfolios

- **Module Integration:** Profiles aren't just text; they are linked to completed Richfield modules. A "Verified SQL" badge appears only after a student completes the relevant database coursework.

- **Project Heatmaps:** A GitHub-style contribution map that shows a student's daily activity—whether they are coding, recording 60-second "Veo" technical walkthroughs, or tutoring others.

3. The Stakeholder Advantage

- **For Students:** Access to a "Campus Layer" where the content is 100% relevant to their current semester. No "hustle culture" posts—just code, tutorials, and internship alerts.
- **For South African CEOs & Recruiters:** A "Pre-Vetted" talent pipeline. Instead of filtering through 1,000 random CVs, recruiters can see a **Leaderboard** of the most active contributors in specific stacks (e.g., "Top 10 Python Developers at Richfield Umhlanga").
- **For the Institution:** Provides real-time analytics on student engagement and technical trends, helping the college align its curriculum with the specific needs of industry partners.

4. Competitive Edge: Why We Win

Feature	**LinkedIn (The Generalist)**	**RTC Hub (The Specialist)**
Validation	Subjective "Endorsements"	**Objective Module-Verified Badges**
Content	Narrative-heavy "Life Updates"	**Technical Snippets & Feature Demos**
Utility	Passive scrolling	**Active Code Collaboration & Debugging**
Recruiting	High-noise / Manual filtering	**High-signal / Data-driven Leaderboards**

5. Proposed Outcome

The RTC Hub aims to transform the Richfield student body from "job seekers" into "sought-after talent." By the end of the first year, the goal is to have a platform where every 3rd-year student has a public, verifiable **"Proof of Work"** portfolio that speaks louder than a traditional degree alone.
